

DETAILED ACTION

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 8/12/10 has been entered.

Applicants amendments and arguments filed 8/12/10 are acknowledged and have been fully considered. Any rejection and/or objection not specifically addressed is herein withdrawn based on applicants amendments/arguments.

Previously, applicants elected Group VIII (claims 1-6,11,13-22) and the peptide species of SEQ ID NO:19 (Gly-Arg-Gly-Asp) and the agent species being an antimicrobial.

As discussed below, claims to the elected species are rejected under 103 based on the prior art. In accord with section 803.02 of the MPEP the claims have been examined with respect to the elected species and claims to non-elected species are withdrawn from consideration.

In the instant case, claims 7-10,12 are drawn to peptides other than the elected peptide.

Claims 7-10,12 remain withdrawn from further consideration pursuant to 37 CFR 1.142(b) as being drawn to a nonelected invention/species, there being no allowable generic or linking claim.

Claims 2,17,20-21,23 have been cancelled.

Claims 1,3-6,11,13-16,18-19,22 are under consideration.

Claim Objections

This objection is a new objection based on applicants amendments.

Claim 1 is objected to because of the following informalities:

Claim 1 recites 'said protease selected'. It appears that the word 'is' should appear after the word 'protease'.

Appropriate correction is required.

Claim Rejections - 35 USC § 112

Claims were previously rejected under 112 2nd. Since the claims have been amended the rejection is updated to correspond to the current claims.

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 1,3-6,13-16,18-19,22 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claims 1 and dependent claims 3-6,13-16,18-19,22 refer to 'protease is associated with wound infection or ulcer formation further wherein said protease selected from the group consisting of protease that are elevated during infection and proteases that are elevated in wounds that are apparently not clinically infected but go on to become infected within a few days'. The term "few days" in claim 1 is a relative term which renders the claim indefinite. The

term "few days" is not defined by the claim, the specification does not provide a standard for ascertaining the requisite degree, and one of ordinary skill in the art would not be reasonably apprised of the scope of the invention. A 'few days' in relation to the age of the universe versus a 'few days' in relation the age of the average human are quite different. It is unclear what falls within the scope of 'apparently not clinically infected but which go on to become infected' as such phrase appears to depend on one's subjective opinion or requires one to predict the future. In other words the claim recites 'which go on to become infected'. The specification has not set forth the specific characteristics of such wounds. The metes and bounds of a 'protease associated with wound infection' is unclear. The word 'associated' as used in the instant claims can be interpreted in different fashions. For example, the term could mean that the wound fluid includes a protease or the term could mean that the presence of wound fluid triggers a cellular pathway to make the protease although the protease need not be present in the wound fluid. Further, the term could merely mean the wound fluid and a protease can be combined (i.e. associated). Claim 1 recites 'not clinically infected but which go on to become infected'. Although the claim refers to 'clinically infected' it then refers to 'infected'. It is unclear if the actual 'infection' is required to be clinical or not. It is noted that section 2111.01 IV of the MPEP states that applicant can be their own lexicographer but must do so with reasonable clarity, deliberateness, and precision. In the instant case, page 4 provides examples (i.e. 'we include'). However, an example is not a definition. It is noted that the claims refer to a matrix joined by cross-linkages which comprise oligopeptide sequences which are cleavable by a protease. Thus 'cleavable by a protease' is a property of the oligopeptide sequence. It is unclear which proteases fall within the scope of the instant claims.

The term "substantially" in claim 18 is a relative term which renders the claim indefinite. The term "substantially" is not defined by the claim, the specification does not provide a standard for ascertaining the requisite degree, and one of ordinary skill in the art would not be reasonably apprised of the scope of the invention.

Response to Arguments 112 2nd rejection

Applicants argue (pages 6-8) that the specification sets forth signs and indications of clinical infection.

Applicants argue that wound fluid may have high levels of enzymes.

Applicants argue that the term 'substantially' can be definite in view of general guidelines presented in the patent application.

Applicant's arguments filed 8/12/10 have been fully considered but they are not persuasive.

Although Applicants argue (pages 6-8) that the specification sets forth signs and indications of clinical infection, a sign of a clinical infection does not allow one to know which proteases or oligopeptide sequences are encompassed by the claims. It is unclear what falls within the scope of 'apparently not clinically infected but which go on to become infected' as such phrase appears to depend on one's subjective opinion or requires one to predict the future. In other words the claim recites 'which go on to become infected'. The specification has not set forth the specific characteristics of such wounds. Further, applicants own arguments on page 11 of the reply dated 8/12/10 are evidence of the lack of clarity of what falls within the scope of the claims. Applicants argue that none of the cited references teach the recited proteases (page 11 of

8/12/10 reply). It is noted that applicants claim 11 recites thrombin as a protease. Suzuki teach that the peptide linkers (see figure 1) are cleaved by thrombin (see table 1). It is unclear how thrombin is a protease that falls within the scope of claim 1 for purposes of applicants own invention, but the prior arts thrombin does not fall within the scope of claim 1.

Although Applicants argue that wound fluid may have high levels of enzymes, it is first noted that an example that 'may' contain does not necessarily contain. In other words, something that 'may' just as easily 'may not'. It is noted that claim 1 for example, is not limited to the examples provided by the applicant. It is noted that claim 11 is not included in the instant rejection. Further, applicants own arguments on page 11 of the reply dated 8/12/10 are evidence of the lack of clarity of what falls within the scope of the claims. Applicants argue that none of the cited references teach the recited proteases (page 11 of 8/12/10 reply). It is noted that applicants claim 11 recites thrombin as a protease. Suzuki teach that the peptide linkers (see figure 1) are cleaved by thrombin (see table 1). It is unclear how thrombin is a protease that falls within the scope of claim 1 for purposes of applicants own invention, but the prior arts thrombin does not fall within the scope of claim 1.

Although Applicants argue that the term 'substantially' can be definite in view of general guidelines presented in the patent application, applicants have not pointed out any general guidelines in the instant specification. The mere use of a term is not a guideline. The term "substantially" is not defined by the claim, the specification does not provide a standard for ascertaining the requisite degree, and one of ordinary skill in the art would not be reasonably apprised of the scope of the invention.

Claims were previously rejected under 112 1st written description. Since the claims have been amended an updated rejection appears below.

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claims 1,3-6,13-16,18-19,22 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention.

The MPEP states that the purpose of the written description requirement is to ensure that the inventor had possession, as of the filing date of the application, of the specific subject matter later claimed by him. The courts have stated:

“To fulfill the written description requirement, a patent specification must describe an invention and do so in sufficient detail that one skilled in the art can clearly conclude that “the inventor invented the claimed invention.” Lockwood v. American Airlines, Inc., 107 F.3d 1565, 1572, 41 USPQ2d 1961, 1966 (Fed. Cir. 1997); In re Gostelli, 872 F.2d 1008, 1012, 10 USPQ2d 1614, 1618 (Fed. Cir. 1989) (“[T]he description must clearly allow persons of ordinary skill in the art to recognize that [the inventor] invented what is claimed.”). Thus, an applicant complies with the written description requirement “by describing the invention, with all its claimed limitations, not that which makes it obvious,” and by using “such descriptive means as words, structures, figures, diagrams, formulas, etc., that set forth the claimed invention.” Lockwood, 107 F.3d at 1572, 41 USPQ2d at 1966.” Regents of the University of California v. Eli Lilly & Co., 43 USPQ2d 1398.

Further, for a broad generic claim, the specification must provide adequate written description to identify the genus of the claim. In Regents of the University of California v. Eli Lilly & Co. the court stated:

“A written description of an invention involving a chemical genus, like a description of a chemical species, ‘requires a precise definition, such as by structure, formula, [or] chemical name,’ of the claimed subject matter sufficient to distinguish it from other materials.” Fiers, 984 F.2d at 1171, 25 USPQ2d 1601; In re Smythe, 480 F.2d 1376, 1383, 178 USPQ 279, 284985 (CCPA 1973) (“In other cases, particularly but not necessarily, chemical cases, where there is unpredictability in performance of certain species or subcombinations other than those specifically enumerated, one skilled in the art may be found not to have been placed in possession of a genus ...”) *Regents of the University of California v. Eli Lilly & Co.*, 43 USPQ2d 1398.

The MPEP further states that if a biomolecule is described only by a functional characteristic, without any disclosed correlation between function and structure of the sequence, it is “not sufficient characteristic for written description purposes, even when accompanied by a method of obtaining the claimed sequence.” MPEP § 2163. The MPEP does state that for a generic claim the genus can be adequately described if the disclosure presents a sufficient number of representative species that encompass the genus. MPEP § 2163. If the genus has a substantial variance, the disclosure must describe a sufficient variety of species to reflect the variation within that genus. See MPEP § 2163. Although the MPEP does not define what constitute a sufficient number of representative species, the courts have indicated what do not constitute a representative number of species to adequately describe a broad generic. In *Gostelli*, the courts determined that the disclosure of two chemical compounds within a subgenus did not describe that subgenus. In re *Gostelli*, 872, F.2d at 1012, 10 USPQ2d at 1618.

The MPEP lists factors that can be used to determine if sufficient evidence of possession has been furnished in the disclosure of the Application. These include “level of skill and knowledge in the art, partial structure, physical and/or chemical properties, functional characteristics alone or coupled with a known or disclosed correlation between structure and function, and the method of making the claimed invention. Disclosure of any combination of

such identifying characteristics that distinguish the claimed invention from other materials and would lead one of skill in the art to the conclusion that the applicant was in possession of the claimed species is sufficient.” MPEP § 2163. While all of the factors have been considered, a sufficient amount for a prima facie case are discussed below.

Further, to provide evidence of possession of a claimed genus, the specification must provide sufficient distinguishing identifying characteristics of the genus. The factors to be considered include: a) the scope of the invention; b) actual reduction to practice; c) disclosure of drawings or structural chemical formulas; d) relevant identifying characteristics including complete structure, partial structure, physical and/or chemical properties, and structure/function correlation; e) method of making the claimed compounds; f) level of skill and knowledge in the art; and g) predictability in the art.

In the instant case, the claims are drawn to wound dressing compositions. Although unclear (see 112 2nd) for purposes of examination the claims have been given the broadest reasonable interpretation (see MPEP 2111). The ‘proteases’ are given the broadest reasonable interpretation. The term ‘substantially’ has been given the broadest reasonable interpretation.

(1) Level of skill and knowledge in the art:

The level of skill in the art is high. However, there is unpredictability in predicting functional properties absent any structure/function relationship. Claim 1 refers to sequences cleavable by a protease associated with wound fluid. Absent any specific structure/function correlation one would not be able to predict such sequences and proteases.

(2) Partial structure:

The claims are drawn to a wound dressing comprising oligopeptide sequences cleavable by a protease. Although unclear (see 112 2nd) for purposes of examination the claims have been given the broadest reasonable interpretation (see MPEP 2111). The 'proteases' are given the broadest reasonable interpretation. The term 'substantially' has been given the broadest reasonable interpretation.

The oligopeptide sequences are described as being cleavable by a protease. The claims (such as claim 11) give examples of several oligopeptide sequences. However, nearly every protein is cleavable by a protease. For example, Matthews (Biochemistry 1996 as cited previously) teach numerous proteases such as trypsin, pepsin, thrombin, and papain that would cleave an oligopeptide sequence. For example trypsin cleaves when R1 is Lys or Arg (see Table 5.4 of Matthews). If one considered a 10 amino acid peptide (R1-R10) oligomer with either Lys or Arg at R1 and any other amino acid except proline at R2 and any amino acid at the other positions there would be at least 20^8 (over 2 billion) possible peptides. Even though approximately 30 different oligopeptide sequences are recited in the specification, the recited peptides do not represent the genus. One of skill in the art would not recognize that the applicant was in possession of wound dressings with oligopeptide sequences of the scope of the genus of claim 1 for example.

The dressing is described as a matrix comprising polymers and a therapeutic agent. The specification (page 5) provides examples of numerous polymers. Claim 1 is very broad with respect to the polymer. Claim 5 is drawn to a specific polymer. Claim 3 is drawn to polymers that are not degraded by protease or other factors. However, no examples are provided of a

matrix comprising polymers and a therapeutic agent. An example appears on page 9 lines 19-25 which recite specific oligopeptide sequences and a specific polymer. This example does not represent the claimed invention because the example does not recite a therapeutic agent. Therapeutic agents are a component of the wound dressing. The agents can be a variety of things (claim 13, page 10). However, no specific examples of wound dressings are provided. Although examples have been provided of components of the wound dressing no examples have been provided of a wound dressing as claimed. The example on page 9 lines 19-25 does not recite any agent.

There is substantial variability in the genus. Since there are a substantial variety of polypeptides possible within the genus, the examples do not constitute a representative number of species and do not sufficiently describe the genus claimed (see Gostelli above).

(3) Physical and/or chemical properties and (4) Functional characteristics:

The oligopeptide sequences are described as being cleavable by a protease. In particular the protease is described as being associated with wound infection or ulcer formation (claims 1 example). Claim 1 recites that the wound dressing is such that the rate of release of the therapeutic agent increases in the presence of the protease. However, there is no correlation provided between structure and function. No common structural attributes identify the members of the genus, in particular the oligopeptide sequences. For example, the recitation of 'associated with wound infection' does not lead one to particular wound dressing compositions or specific oligopeptide sequences. From the phrase 'rate of release of the therapeutic agent increases in the presence of the protease', one of skill in the art would not conclude any structural information. No common core sequence is taught for all the possible alternatives. One of skill in the art would

reasonably conclude that the disclosure fails to provide a representative number of species or sufficient relevant identifying characteristics.

Regarding the polymer it is noted that claim 3 is drawn to polymers that are not degraded by protease or other factors. However, there is no correlation provided between structure and function. No common structural attributes identify the members of the genus, in particular the polymers that are not degraded by protease or other factors. From the phrase 'are not degraded by the protease or other factors', one of skill in the art would not conclude any structural information. One of skill in the art would reasonably conclude that the disclosure fails to provide a representative number of species or sufficient relevant identifying characteristics.

(5) Method of making the claimed invention:

The specification does not describe any specific embodiments of wound dressings nor methods of making them.

As stated supra, the MPEP states that written description for a genus can be achieved by a representative number of species within a broad generic. It is unquestionable that claim(s) 1,3-6,13-16,18-19,22 are broad and generic, with respect to all possible wound dressings encompassed by the claims. The possible structural variations are limitless to any agent, polymer, and peptide meeting the claim limitations. Although the claims may recite some functional characteristics, the claims lack written description because there is no disclosure of a correlation between function and structure of the components beyond those components specifically disclosed in the examples in the specification. Moreover, the specification lacks sufficient variety of species to reflect this variance in the genus. While having written description of polypeptides identified in the specification tables and/or examples, the

specification does not provide sufficient descriptive support for the myriad of wound dressings embraced by the claims.

The description requirement of the patent statute requires a description of an invention, not an indication of a result that one might achieve if one made that invention. See *In re Wilder*, 736, F.2d 1516, 1521, 222 USPQ 369, 372-73 (Fed. Cir. 1984) (affirming rejection because the specification does “little more than outlin[e] goals appellants hope the claimed invention achieves and the problems the invention will hopefully ameliorate.”) Accordingly, it is deemed that the specification fails to provide adequate written description for the genus of the claims and does not reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the entire scope of the claimed invention

Response to Arguments 112 1st rejection

Applicants argue (pages 9-10) that they have provided examples of wound fluids that may contain proteases that may be associated with wound infection.

Applicants argue that examples of therapeutic agents are provided and are well-known in the art.

Applicant's arguments filed 8/12/10 have been fully considered but they are not persuasive.

Although Applicants argue (pages 9-10) that they have provided examples of wound fluids that may contain proteases that may be associated with wound infection, it is first noted that an example that ‘may’ contain does not necessarily contain. In other words, something that ‘may’ just as easily ‘may not’. It is noted that claim 1 for example, is not limited to the examples provided by the applicant. It is noted that claim 11 is not included in the instant rejection.

Further, as discussed above the claims remain unclear. Applicants examples would not lead one to a significant structural core. Further, the specification does not provide a correlation between structure and function. The specification provides limited examples which are not representative of the breadth of the genus. Further, examples are one of numerous factors to consider (see MPEP section 2163). In the instant case, 5 different factors are discussed above.

Although Applicants argue that examples of therapeutic agents are provided and are well-known in the art, claim 1 is drawn to a wound dressing which comprises polymers and oligopeptide sequences. As such, the claim is broad with respect to the polymers and oligopeptide sequences. The claim would not lead one to a specific core structure for the wound dressing. The agent is an additional element that does not define the core of the polymer or oligopeptide.

Claim Rejections - 35 USC § 103

Claims were previously rejected under 103 based on the references cited below. Since the claims have been amended the rejection is updated to correspond to the current claims.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1,3-4,6,13-16,18-19,22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Peppas et al (European Journal of Pharmaceutics and Biopharmaceutics 2000, 50:27-46) and Suzuki et al (J Biomed Mater Res 1998, 42:112-116) and Arnold (EP 0599589 as cited in IDS).

Peppas teach that hydrogels have numerous applications (abstract). Peppas teach that stimuli-sensitive hydrogel drug delivery systems are known in the art (page 34). Peppas specifically teach that Suzuki and associates prepared a PVA-based hydrogel with specially designed thrombin sensitive linkers (page 34-35 connecting paragraph). Peppas teach that antibiotics are released from the hydrogel only in the presence of infection (page 34-35 connecting paragraph). Peppas teach that the hydrogel can be used for a wound dressing with microbial infection-responsive controlled release antibiotics (page 34-35 connecting paragraph).

Peppas does not specifically teach a wound dressing with the components (in particular the layers) of the instant invention.

Since Peppas refers to the work of Suzuki and associates (page 34 last paragraph and reference 104) and suggest the use as a wound dressing (page 35) one would be motivated to use the information of the Suzuki reference. Suzuki teach a need for wound dressings with antibiotic release stimulated by microbial infection (page 112). Suzuki teach a PVA-(linker)-GM (where PVA is polyvinyl alcohol derivative and GM is gentamicin) delivery system (page 113 and Figure 1). Suzuki teach that various peptide linkers were tested in the presence of thrombin (table I). Suzuki teach that PVA-(linker)-GM showed selective release of gentamicin in wound fluid (page 115) and teach that the system could be applicable to numerous wound dressing applications (page 115 last paragraph).

Since both Peppas (page 35) and Suzuki (page 115) teach the use of the PVA-(linker)-GM as a wound dressing one would be motivated to formulate the system for wound dressing. Arnold teach wound dressings which are well known in the art (sections 0002-0010) and teach that a particular multi-layer wound dressing has been developed that has the advantages of the prior art and provides for improved wound healing (section 0011). Arnold specifically teach a wound dressing (section 0012, claims, Figure 1) that comprises a liquid permeable wound contacting layer, an intermediate layer and a outer protective layer that is impermeable to liquids (section 0022). Arnold teach the presence of a wound healing agent in one of the layers (section 0012). Arnold teach the presence of an absorbent layer to absorb wound exudate (section 0021). Arnold teach that the wound contacting layer may include compounds to assist wound healing (section 0027-0028). Arnold teach that the dressing inner layer has a particular pore size (section 0012).

Taken together, since both Peppas (page 35) and Suzuki (page 115) teach the use of the PVA-(linker)-GM as a wound dressing one would be motivated to formulate the system as a wound dressing using the wound dressing as taught by Arnold since Arnold teach a particular wound dressing that has the advantages of the prior art and provides for improved wound healing (section 0011). In particular, one would be motivated to use the PVA-(linker)-GM system of Suzuki in the wound dressing of Arnold. Since Suzuki teach PVA (polyvinyl alcohol derivative) the polymer limitations of claim 1 and 4 are met. Since Suzuki teach specific thrombin sensitive peptides (Table I) the peptide limitations of claims 1,6 are met. Since Suzuki teach GM (gentamicin) the limitations of claim 13 are met. In figure 1 of Suzuki the configuration of the system is shown. It is noted that the instant claims refer to cross-linkages. Since Figure 1 of Suzuki shows multiple monomeric units cross-linked together the system includes a matrix of cross-linked monomers. Further, since the peptide is part of the monomeric unit the cross-links comprise oligopeptide sequences as recited in claim 1. Since Suzuki teach that the peptides are thrombin sensitive the peptides are cleavable by a protease as recited in claim 1. Since Suzuki teach that the gentamicin is released and there is no evidence of degradation of the polymers the limitations of claim 3 are met absence evidence to the contrary. Based on Figure 1 of Suzuki it is shown that the gentamicin is in a donor layer and within a matrix and behind the barrier layer as recited in claims 1,14,18,22. It is noted that claim 19 provides no frame of reference with respect to the orientation of behind. From figure 1 of Suzuki it is clear that at least one molecule of gentamicin would be behind the barrier layer. With respect to the layers, Arnold teach (section 0012, claims, Figure 1) layers I,II, and III as in the instant claims. Since Arnold teach the presence of a wound healing agent in one of the layers (section 0012) one would be motivated to

incorporate the PVA-(linker)-GM system of Suzuki to a layer near the wound thus meeting the limitations of claim 1 of the instant invention. Since Arnold teach the presence of an absorbent layer to absorb wound exudate (section 0021) one would be motivated to include such layer thus meeting the limitations of claim 22. Since Arnold teach a outer protective layer that is impermeable to liquids (section 0022) any apertures would be substantially blocked as recited in claim 18. Since Arnold teach that the wound contacting layer may include compounds to assist wound healing (section 0027-0028) one would be motivated to include the PVA-(linker)-GM system in the wound contacting layer as recited in claims 14-15. Since Arnold teach that the intermediate layer may comprise a wound healing agent (section 0012) one would be motivated to include the PVA-(linker)-GM system on the wound contacting layer as recited in claims 14,16.

In the instant case, both Peppas and Suzuki set forth a specific antibiotic drug delivery system and motivate applications for wound healing. Since Arnold teach a particular wound dressing that has the advantages of the prior art and provides for improved wound healing (section 0011) one would be motivated to use the specific components of the dressing of Arnold. Since Suzuki teach that PVA-(linker)-GM showed selective release of gentamicin in wound fluid (page 115) and teach that the system could be applicable to numerous wound dressing applications (page 115 last paragraph) and Arnold teach a particular wound dressing that has the advantages of the prior art and provides for improved wound healing (section 0011) one would have a reasonable expectation of success.

Although unclear (see 112 2nd) for purposes of examination the claims have been given the broadest reasonable interpretation (see MPEP 2111). The 'proteases' are given the broadest

reasonable interpretation. In the instant case Peppas specifically teach that Suzuki and associates prepared a PVA-based hydrogel with specially designed thrombin sensitive linkers (page 34-35 connecting paragraph). The term 'substantially' has been given the broadest reasonable interpretation.

Claims 1,3-6,13-16,18-19,22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Peppas et al (European Journal of Pharmaceutics and Biopharmaceutics 2000, 50:27-46) and Suzuki et al (J Biomed Mater Res 1998, 42:112-116) and Arnold (EP 0599589 as cited in IDS) and Ulbrich et al (Journal of Controlled Release 2000, 64:63-70 as cited in IDS).

As discussed above, Peppas and Suzuki and Arnold suggest claims 1,3-4,6,13-16,18-19,22.

The references do not teach in a single embodiment the polymer of claim 5.

Peppas teach (Table 1) a variety of monomers that are known to be used for pharmaceutical applications including VA and HPMA. Peppas teach that the chemical nature of the group used controls the properties and a number of monomers have been prepared with desired properties (page 28 section 2.1). Ulbrich specifically the use of HPMA conjugates (abstract). Ulbrich teach that the HPMA backbone is modified by biodegradable peptide side chains (page 64 1st column) and teach that conjugates provided promising data in tests (page 78). Since Peppas teach that certain monomers have desired properties one would be motivated to substitute the PVA as taught by Suzuki with the HPMA as taught by Peppas and Ulbrich. The resulting systems would include the specific polymer recited in claim 5 of the instant invention.

The instant claims would have been obvious because the substitution of one known element (HPMA) for another (PVA) would have yielded predictable results to one of ordinary skill in the art at the time of the invention.

Although unclear (see 112 2nd) for purposes of examination the claims have been given the broadest reasonable interpretation (see MPEP 2111). The 'proteases' are given the broadest reasonable interpretation. In the instant case Peppas specifically teach that Suzuki and associates prepared a PVA-based hydrogel with specially designed thrombin sensitive linkers (page 34-35 connecting paragraph). The term 'substantially' has been given the broadest reasonable interpretation.

Claims 1,3-6,11,13-16,18-19,22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Peppas et al (European Journal of Pharmaceutics and Biopharmaceutics 2000, 50:27-46) and Suzuki et al (J Biomed Mater Res 1998, 42:112-116) and Arnold (EP 0599589 as cited in IDS) and Ulbrich et al (Journal of controlled Release 2000, 64:63-70 as cited in IDS) and Pachence et al (WO 00/64486 as cited in IDS).

As discussed above, Peppas and Suzuki, Arnold, Ulbrich suggest claims 1,3-6,13-16,18-19,22.

The references do not specifically teach the peptides of claim 11.

Peppas recognizes (page 34) and Suzuki teaches (Table I) specific thrombin sensitive linkers. In fact, Suzuki tests various thrombin linkers (Table I) and reports various cleavage ratios for the linkers. Pachence teach Gly-Arg-Gly-Asp as a thrombin cleavage site (claims 28-

29, page 16, lines 24-26, page 37 lines 9-14). Since Suzuki teach various linkers one would be motivated to test and use known linkers including the Gly-Arg-Gly-Asp as taught by Pachence to determine linkers with optimal cleavage ratios. When substituting the Gly-Arg-Gly-Asp for the peptide of Suzuki the resulting system meet the limitation of claim 11 of the instant invention.

The instant claims would have been obvious because the substitution of one known element (thrombin cleavage sites taught by Pachence) for another (thrombin cleavage sites taught by Suzuki) would have yielded predictable results to one of ordinary skill in the art at the time of the invention.

Although unclear (see 112 2nd) for purposes of examination the claims have been given the broadest reasonable interpretation (see MPEP 2111). The ‘proteases’ are given the broadest reasonable interpretation. In the instant case Peppas specifically teach that Suzuki and associates prepared a PVA-based hydrogel with specially designed thrombin sensitive linkers (page 34-35 connecting paragraph). The term ‘substantially’ has been given the broadest reasonable interpretation.

Response to Arguments 103 rejections

Applicants argue (pages 10-14) that the references do not teach or suggest the claimed pore structure.

Applicants argue that none of the cited references teach the recited proteases or polymers with cross-linkages.

Applicants argue that Ulbrich and Pachence do not teach the proteases or cross-linkages as claimed.

Applicant's arguments filed 8/12/10 have been fully considered but they are not persuasive.

Although Applicants argue (pages 10-11) that the references do not teach or suggest the claimed pore structure, it is noted that the word 'pore' is not used in the instant claims. Limitations from the specification or applicants arguments are not read into the claims (see MPEP 2111). In response to applicant's argument that the references fail to show certain features of applicant's invention, it is noted that the features upon which applicant relies (i.e., pores) are not recited in the rejected claim(s). Although the claims are interpreted in light of the specification, limitations from the specification are not read into the claims. See *In re Van Geuns*, 988 F.2d 1181, 26 USPQ2d 1057 (Fed. Cir. 1993). As discussed in the rejection the prior art suggest the instant claim limitations. For example, Suzuki teach that PVA-(linker)-GM showed selective release of gentamicin in wound fluid (page 115). The title of Suzuki expressly recite controlled release of antibiotic in the presence of infection.

Although Applicants argue that none of the cited references teach the recited proteases or polymers with cross-linkages, it is noted that the instant rejection is a multiple reference 103 rejection. Thus, any single reference does not necessarily teach all of the claim limitations. It is noted that applicants claim 11 recites thrombin as a protease. Suzuki teach that the peptide linkers (see figure 1) are cleaved by thrombin (see table 1). Although unclear, since applicants own claim expressly recites thrombin (claim 11), and Suzuki recite thrombin there is a reasonable basis that the claim limitation is met. Further, it is noted that the claims are not drawn to proteases. As claimed, the oligopeptide sequences are cleavable by a protease. Thus 'cleavable by a protease' is a property of the oligopeptide sequence. The claims do not appear to require a

protease. Further, Peppas expressly teach that there are 'specially designed thrombin-sensitive peptide linkers' (page 34 last paragraph). Suzuki shows such linkers in Table I. It is noted that claim 11 expressly recites thrombin as a protease. As such, the references do teach an acceptable sequence that is cleavable by a protease. Further, as stated previously in 112 1st rejections, Matthews (Biochemistry 1996 as cited previously) teach numerous proteases such as trypsin, pepsin, thrombin, and papain that would cleave an oligopeptide sequence. For example trypsin cleaves when R1 is Lys or Arg (see Table 5.4 of Matthews). Thus the peptide linkers of Suzuki (see Table I) are also cleavable by trypsin since they contain Arg. With respect to the cross-linkages, Suzuki teach that PVA-(linker)-GM showed selective release of gentamicin in wound fluid (page 115) and Suzuki teach specific cross-linkages (Table I). In response to applicant's arguments against the references individually, one cannot show nonobviousness by attacking references individually where the rejections are based on combinations of references. See *In re Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA 1981); *In re Merck & Co.*, 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986).

Although Applicants argue that Ulbrich and Pachence do not teach the proteases or cross-linkages as claimed, one cannot show nonobviousness by attacking references individually where the rejections are based on combinations of references. See *In re Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA 1981); *In re Merck & Co.*, 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986). As discussed in the rejection the prior art suggest the instant claim limitations. For example, Suzuki teach that PVA-(linker)-GM showed selective release of gentamicin in wound fluid (page 115). The title of Suzuki expressly recite controlled release of antibiotic in the presence of infection.

Double Patenting

Claims were previously rejected under double patenting based on application 12041955. Since the claims have been amended the rejection is updated to correspond to the current claims.

The terminal disclaimer filed on 3/30/09 disclaiming the terminal portion of any patent granted on this application which would extend beyond the expiration date of any patent granted on Application Number 10/529,156 has been reviewed and is accepted. The terminal disclaimer has been recorded.

The terminal disclaimer filed on 3/30/09 disclaiming the terminal portion of any patent granted on this application which would extend beyond the expiration date of any patent granted on Application Number 10/497,442 has been reviewed and is accepted. The terminal disclaimer has been recorded.

The terminal disclaimer filed on 3/30/09 disclaiming the terminal portion of any patent granted on this application which would extend beyond the expiration date of US 7,361,634 has been reviewed and is accepted. The terminal disclaimer has been recorded.

The terminal disclaimer filed on 3/30/09 disclaiming the terminal portion of any patent granted on this application which would extend beyond the expiration date of any patent granted on Application Number 10/579,897 has been reviewed and is accepted. The terminal disclaimer has been recorded.

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the “right to exclude” granted by a patent and to prevent possible harassment by multiple assignees. A nonstatutory obviousness-type double patenting rejection is appropriate where the conflicting claims are not identical, but at least one examined application claim is not patentably distinct from the reference claim(s) because the examined application claim is either anticipated by, or would have been obvious over, the reference claim(s). See, e.g., *In re Berg*, 140 F.3d 1428, 46 USPQ2d 1226 (Fed. Cir. 1998); *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) or 1.321(d) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent either is shown to be commonly owned with this application, or claims an invention made as a result of activities undertaken within the scope of a joint research agreement.

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claims 1,3-6,13-16,18-19,22 are provisionally rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-4,7-16 of copending Application No. 12/041,955 (‘955) in view of Arnold (EP 0599589 as cited in IDS).

‘955 teach wound dressings comprising HPMA (claim 4) and specific peptide sequences cleavable by a protease (claim 1). Since HPMA is taught the polymer limitations of claims 4-5 are met. ‘955 teach that the polymers are not degraded (claim 2) as recited in claim 3. ‘955 teach antimicrobials (claim 7) as in claim 13 of the instant invention. ‘955 teach apertures (claim 12) as in claim 18 of the instant invention. ‘955 teach an absorbent layer (claim 16) as in claim 22 of the instant invention. ‘955 teach various layers and configurations (claims 9-10).

‘955 does not teach all of the layers as in the instant claims.

Since '955 teach wound dressings one would be motivated to make specific wound dressings.

Arnold teach wound dressings which are well known in the art (sections 0002-0010) and teach that a particular wound dressing has been developed that has the advantages of the prior art and provides for improved wound healing (section 0011). Arnold specifically teach a wound dressing (section 0012, claims, Figure 1) that comprises a liquid permeable wound contacting layer, an intermediate layer and a outer protective layer that is impermeable to liquids (section 0022). Arnold teach the presence of a wound healing agent in one of the layers (section 0012). Arnold teach the presence of an absorbent layer to absorb wound exudate (section 0021). Arnold teach that the wound contacting layer may include compounds to assist wound healing (section 0027-0028). Arnold teach that the dressing inner layer has a particular pore size (section 0012).

Taken together, since '955 teach the use of specific structures as a wound dressing one would be motivated to formulate the system as a wound dressing using the wound dressing as taught by Arnold since Arnold teach a particular wound dressing that has the advantages of the prior art and provides for improved wound healing (section 0011). Since '955 teach HEMA the polymer limitations of claims 1,4-5 are met. '955 teach specific peptides the peptide limitations of claims 1,6 are met. Since '955 teach antibiotics the limitations of claim 13 are met. With respect to the layers, Arnold teach (section 0012, claims, Figure 1) layers I,II, and III as in the instant claims. Since Arnold teach that the presence of a wound healing agent in one of the layers (section 0012) one would be motivated to incorporate structure of '955 thus meeting the limitations of claim 1 of the instant invention.

Although unclear (see 112 2nd) for purposes of examination the claims have been given the broadest reasonable interpretation (see MPEP 2111). The ‘proteases’ are given the broadest reasonable interpretation. The term ‘substantially’ has been given the broadest reasonable interpretation.

This is a provisional obviousness-type double patenting rejection.

Claims 1,3-6,13-16,18-19,22 are directed to an invention not patentably distinct from claims 1-4,7-16 of commonly assigned 12/041,955 as discussed above.

The U.S. Patent and Trademark Office normally will not institute an interference between applications or a patent and an application of common ownership (see MPEP Chapter 2300). Commonly assigned 12/041,955, discussed above, would form the basis for a rejection of the noted claims under 35 U.S.C. 103(a) if the commonly assigned case qualifies as prior art under 35 U.S.C. 102(e), (f) or (g) and the conflicting inventions were not commonly owned at the time the invention in this application was made. In order for the examiner to resolve this issue, the assignee can, under 35 U.S.C. 103(c) and 37 CFR 1.78(c), either show that the conflicting inventions were commonly owned at the time the invention in this application was made, or name the prior inventor of the conflicting subject matter.

A showing that the inventions were commonly owned at the time the invention in this application was made will preclude a rejection under 35 U.S.C. 103(a) based upon the commonly assigned case as a reference under 35 U.S.C. 102(f) or (g), or 35 U.S.C. 102(e) for applications pending on or after December 10, 2004.

Response to Arguments double patenting rejection

Applicants argue (page 14) that they disagree and request that the rejection be held in abeyance.

Applicant's arguments filed 8/12/10 have been fully considered but they are not persuasive.

Although Applicants argue (page 14) that they disagree and request that the rejection be held in abeyance, applicants have not articulated why they disagree. Thus applicants are merely making assertions. Further, a request to hold in abeyance does not overcome the rejection.

Prior art of record

The prior art previously made of record and not relied upon is considered pertinent to applicant's disclosure.

Sojomihardjo et al (WO 96/40829 as cited previously) teach (claim 18 page 53) an article comprising a crosslinked polypeptide (i.e. a matrix comprising polymers – polypeptides are polymers) having a biologically active material (i.e. therapeutic agent) entrapped therein. Sojomihardjo teach the compositions as wound dressings (abstract last sentence, claim 6).

Woerly et al. (Biomaterials (2001 v22 pages 1095-1111 as cited previously). Woerly teach PHMPA interconnected with specific peptides such as GGRGD (abstract, Figure 1). Any rejection using Woerly would be repetitive of the rejections above.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to RONALD NIEBAUER whose telephone number is (571)270-3059. The examiner can normally be reached on Monday-Thursday, 7:30am-5:00pm, alt. Friday, EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Cecilia Tsang can be reached on 571-272-0562. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
